ONLINE ACTIVITY #2
Personalized Linux, and Git Cheat Sheet

Using any available resources (official Git documentation, online tutorials, or the built-in git --help command), research the following topics and create a personalized 1-page (A4) cheat sheet:

1. Basic Linux commands (command, sample usage) (at least 10)
2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags

git init	git restore
git status	git branch
git add	git checkout / git switch
git commit	git merge
git log	git tag
git diff	git clone

3. the three-tree architecture of Git

You are free to use any design or color scheme, just make sure it is readable.

Submission:

1. Use PDF as the file format for your cheat sheet.
2. Upload it to your GitHub repository
3. Submit the link here: <https://drive.google.com/drive/folders/1-Y6e6E6PoLyGgB0WZ8prRCNfolpV3cj0?usp=sharing>

1. Basic Linux commands

Command	Descriptions	Sample Usage
ls	Shows files and folders.	ls
pwd	Shows current directory.	pwd
mkdir	Creates a new directory or folder.	mkdir sample folder
cd	Moves to another folder or directory.	cd sample folder
rmdir	Deletes an empty folder.	rmdir sample folder
cat	Shows what's inside a file.	cat sample.txt
cp	Copies a file or folder.	cp file1.txt file2 .txt
mv	Moves or renames a file or folder.	mv file1.txt file2.txt
rm	Deletes a file.	rm file.txt
uname	Displays information about the operating system.	uname

2. Basic Git commands

Command	Descriptions	Sample Usage
git init	Starts a new repository.	git init
git status	Check files you added.	git status
git add	Adds files for commit.	git add <file>
git commit	Saves your changes.	git commit -m "message"
git log	Shows commit history.	git log
git diff	Shows file changes.	git diff HEAD
git restore	Removes changes from a file.	git add <file>
git branch	Shows or creates branches.	git branch
git checkout / git switch	Switches between branches.	git switch <name>, git checkout <name>
git merge	Combines two branches.	git merge <name>
git tag	Name a version of specific commit.	git tag v1.0
git clone	Copies an existing repository.	git clone <url>

3. the three-tree architecture of Git

1. Working Directory

The Working Directory, contains the files you are currently working on. Changes made in this area are considered “untracked”. This is where:

- Edit files
- Add new files
- Delete files

2. Index (Staging Area)

The Index, also called the staging area, is where you prepare the changes you want to commit. You can review your changes and choose which files or parts of files should be included in the next commit.

3. Repository

The Repository is where Git stores the project's history and saved changes. It contains commits, branches, tags, and other information about the project. When you commit changes, they are moved from the index to the repository.

The three-tier architecture of Git consists of the repository, index, and working directory.
